Dela Cruz, Mark Ivhyn

Fortit, Jhonmark

Ramirez, John Lee T.

Abo, Alexa Alliah A.

Cumalde, Archelle

PR2 Teacher: Mr. Jazam Laranio

Instruction: Identify one problem in the school that could potentially be addressed through software, hardware, or a HYBRID/IOT solution.

"Online Voting Portal with Built-In Candidate Profiles and Platforms for Student Council Elections"

School Problem: What specific problem have you observed?

Candidates do promote themselves on social media and room to room campaigns, students sometimes lose access to this information during actual voting, though partylists' have social media, voters will have to switch between tabs, apps, or social media pages to review candidate credentials and platforms. Google Form also can add credentials, but it is a text-based web so it is going look long and complicated if we add the candidates' credentials and platforms.

Affected Users: Who experiences this problem?

Student Voters: Students who wants to be informed and sure about their decision when voting without the hassle of navigating back and fourth between social media and the voting web.

Candidate: So the candidates have a fair voting because the students will be informed about their credentials, platforms, and their key advocacy.

Initial Evidence: What have you observed, and what information would you need to verify the problem?

Student Council Election Candidates campaign room to room, though they show presentation of their advocacy and credentials, some students couldn't read the presentation in their school television often

because the texts are small or the television itself being small. Furthermore, they also present or speak but students may often forget it afterwards and not at all times they may campaign in every classroom.

When voting, the school uses Google Forms for the students to vote. To make sure they're voting for the right candidates, they may check the partylists' social media but it can be bothersome to go back and forth. Though some can memorize the ones they want to vote.

A way to verify the problem is to get feedback from students who have voted in the recent elections, know their experiences, and what problems they have faced when voting or looking for the right candidates to vote.

Research Question: What question/s should you investigate before proposing a solution?

- What improvements can we do to the current voting system?
- Is the current voting system efficient or can it be more improved?

Possible Capstone Output: What might you develop?

An online voting website with integrated candidate profiles, credentials, and platforms for Systems Plus Computer College Student Council Elections. The system will allow students to cast their votes online while viewing the candidates' profiles, credentials, and platforms in the same portal.

Project Type: Software, hardware, or hybrid/IoT.

- **Project Type: Software**

The proposed project is classified as a *software-based solution* because it involves developing an Online Voting Portal for SPCC Student Council Elections.

This will help students access important information about the candidates without switching between different social media platforms or other sources.

The system aims to make the voting process more convenient, accessible, and informed.

Evaluation: How might you determine whether your proposed solution works?

We will only know if our solution is successful or effective by testing the online voting portal with SPCC students. We will check whether they find it easier to access the portal and if they can clearly view each candidates' platforms, profile, and credentials.

Additionally, we will gather feedback from those who test it to better determine whether our SPCC voting portal works as intended and serves its purpose.
